

MVP system UAT and release gate

Role access, lifecycle workflows, security, reliability, UI consistency, dependencies and launch decisions

Audit date	Production release	Scope
17 September 2026	d42eb8ef6920	All delivered platform, school, teaching, family and operations workflows

Release decision

MVP release gate: PASS. Database migrations are applied, production is healthy and the signed-in owner route sweep is complete.

The release passes ESLint, strict TypeScript, 22 unit tests, the optimized production build and a clean disposable PostgreSQL regression. The role suite covers the platform operator, school owner, administrator, principal, teacher, staff, parent, student and cross-tenant access. The linked public schema linter is clean. No environment secret is stored in this report or the repository.

Quality gate	Result
ESLint	Pass
Strict TypeScript	Pass
Unit tests	22 / 22 pass
Production build	Pass - 29 page-data jobs and all dynamic routes compiled
Disposable PostgreSQL regression	Pass - migrations, role matrix, isolation and rollback
Secret review	Pass - no environment values added or printed

MVP workflow status

Area	Status	Outcome
Platform console	Ready	Allowlisted operators create, enrich, pilot, price, archive and restore tenants.
School owner / administrator	Ready	Manage assigned school, branches, people invitations and access. Tenant creation is absent.
Principal	Ready	Academic leadership, reports, attendance, approvals and publication without platform powers.
Teacher	Ready	Allocated classes, attendance, diary, homework, assessments, feedback and subject reports.
Staff	Ready - decision	Operational support within tenant/campus scope; no tenant-access administration.
Student	Ready	Own learning, results, attendance, notices, fees, transport, report cards and transcript.
Parent	Ready	Linked-child learning, records, homework, fees, transport and communications.
Reports and dashboards	Ready	Role-specific evidence, explicit thresholds, period filters and source drill-down.
Formal records	Ready	Templates, periods, atomic registers, controlled publication, print/PDF and transcript.
Communication	In-app MVP	Announcements, acknowledgement, workflow feedback, inbox and publication alerts.
Operations	Ready	Health, redacted incidents, release identity and audit signals.

Verified defects fixed

- Removed school-tenant creation from the school-owner Command Centre and revoked the legacy authenticated provisioning RPC.
- Limited report-card roster generation to school leaders and staff.
- Added database enforcement for immutable report identity, valid status transitions and protected workflow timestamps.
- Replaced row-by-row overall-comment writes with one validated atomic operation.
- Blocked submission when a class has no subject records or any subject grade is missing.
- Redirected unauthorized template-tab requests to a valid reporting-period view.
- Replaced the unusable teacher generation button with a clear awaiting-setup state, and replaced raw grading-scale JSON with grade | description rows.
- Added recipient-scoped family notifications when a report card is published.
- Added formal-record and transcript navigation for the correct roles.
- Repaired the hosted access-directory return type and verified the live owner directory plus linked schema lint.

Role and security evidence

Role	Verified boundary
Platform operator	Trusted service operations provision tenants; school accounts cannot call platform functions.
School owner	Manages assigned tenants and owner-level school access; cannot create platform tenants.
Administrator	Cannot demote owners or grant administrator access beyond authority.
Principal	Can approve formal academic records; receives no platform access.
Teacher	Assigned registers only; no access enumeration; suspended access stops immediately.
Staff	Student operations allowed; tenant creation and access enumeration denied.
Parent	One linked learner; no unrelated, draft or submitted records.
Student	Own published results and records only.
Other tenant	No student, mark, notification or report-card visibility.

UI, accessibility and reliability

- Every visible shell navigation item resolves to an implemented route. Generic planned pages state unavailable, list intended capability and provide a return path.
- Tabs, cards, status labels, empty states and actions share the existing Northstar patterns across Platform, Academics, Homework, Assessments and Reports.
- New form controls have programmatic labels. Status is conveyed by text as well as colour. Tables have headings and report-print actions have accessible names.
- Responsive rules collapse KPI, workflow and editor grids at tablet and mobile widths without hiding actions.
- Class generation is idempotent; attendance, marks, comments, payments and report registers use atomic operations and invalid batches roll back.
- Drafts remain private. Submitted and published records lock. Publication gives each linked family account an exact-record in-app link.

Dependencies and known limits

Dependency	Current behaviour	Needed
Email / SMS	Consent and ledgers exist; provider disabled.	Provider, credentials, templates, retry worker, cost and retention policy.
Direct messaging	Announcements and workflow feedback only.	Safeguarding, moderation, retention, escalation and attachment rules.
Online fees	Invoices and controlled manual payment.	Gateway, signed webhooks, reconciliation and refunds.
Offline	Connectivity required.	Encrypted queue, conflict resolution and device policy.
Report corrections	Published cards immutable.	Amendment, reapproval, version history and reissue.
Board formats	Generic templates.	CBSE/CISCE/state/IB packs, GPA, promotion and signature rules.
Recovery	Transactions and constraints tested.	Supabase backup/PITR verification and restoration drill.
Performance	Build and architecture pass.	CI LCP, INP and CLS budgets on representative data.
Multi-role identity	One role per email per school.	Combined staff-parent model and role switching.

Decisions required before broader pilot

1. Should school owners and administrators continue to create branches, or should all branch changes be platform-operated? Tenant creation is already platform-only.
2. Should staff default to all-branch operational access or require a branch on every membership?
3. Which board-specific report formats, grading calculations, promotion rules and signature requirements are mandatory for the first pilot?
4. What is the correction policy for a published report: amendment, withdrawal and reissue, or versioned replacement?
5. Is direct teacher-family messaging in MVP scope? If yes, approve safeguarding, moderation, retention, attachment and escalation rules first.
6. Which provider should deliver transactional email and SMS, and what consent, retention and monthly cost caps apply?
7. Which payment gateway and reconciliation owner should support online fees?
8. What recovery-time and recovery-point objectives must be contracted and tested?
9. Which named teacher, parent, student, staff, principal and finance users will sign off pilot acceptance?

Post-deployment UAT

- Applied formal-record and access-directory repair migrations to the linked production database.
- Verified /api/health reports healthy configuration and database state on release d42eb8ef6920.
- Verified the owner Command Centre has no tenant-creation control and the assigned owner access directory loads.
- Verified Report cards is present in role-aware navigation and the owner workspace loads against production.
- Named users must still accept teacher, parent, student, staff, principal and finance pilot accounts.
- A pilot must run one report end to end and validate 390 px behavior on supported school hardware.
